

Denormalization

For our project, we decided to denormalize the zipcode for office and snail-mail address by removing the ziplocation class because Miming's restaurant is a small business and it does not offer delivery option. Therefore, we do not need to have a separate class to validate the zip code. Having a ziplocation class will result in large table of data which is not needed for a small business like Miming's restaurant.

We implemented normalization for all other multivalued attributes like expertise for sous chef and stations in line cook.
